Secondary cultures obtained from phagolysates of
dysentery bacilli were not very active. They could
be regenerated by repeated culturing on a nutrient

271T33

medium. Secondary culture No 23 exhibited a common
antigenic structure with the initial strain. By
cross-agglutination, the mutual resemblance of
antigenic structures of different secondary cul-
tures as well as of secondary initial strains
could be shown. The immune serum obtained by
immunizing rabbits with a secondary culture pro-
tected mice from lethal doses of the culture and
of the initial strain. Animals immunized with the
initial strain were more resistant to a homologous
culture than to secondary cultures. Immunization
with secondary cultures did not assure complete
protection against the initial strain, while there
was pronounced resistance to homologous cultures.

Title : An Immunological Study of the Protein Fractions
of Directly Altered Bacteria of the Intestinal
Group

Orig Pub: Zh. mikrobiol., epidemiol., i immunobiologii, 1955,
No. 8, 20-30

Abstract: The antigen structure of intestinal bacilli,
Breslau paratyphous bacteria, alkali-formers
obtained by the cultivation of intestinal bacilli
in a culture of Breslau bacteria killed by heat-
ing, and paratyphoid obtained by the cultivation

Card 1/5

USSR /Microbiology. Medical and Veterinary
Microbiology.

F-6

Abs Jour: Referat. Zh.-Biol., No. 9, 1957, 35644

of alkali-formers also in a culture of Breslau bacteria killed by heating, was studied by the method of immuno-chemical analysis. By means of a selection of colonies of named variants and their successive strengthening, strains were obtained, the properties of which when preserved in a semifluid agar (pH 7.4) under vaseline oil, remained unchanged over a period of 6 years. From a microbe mass obtained by means of a washing of a 20-hour agar culture, after treatment with alcohol and ether, nucleoproteids were extracted with the help of 0.14 and 1 M NaCl, and proteins of the non-nucleoproteid type by alkalies. The remainder of the bacterial bodies consisted of proteins with the exception of alkali-formers, which contained also a great quantity of matter of

Card 2/5

Microbiology.

F-6

Abs Jour: Referat. Zh.-Biol., No. 9, 1957, 356⁴⁴

a carbohydrate nature. The extracts received were subjected to a fractional precipitation successively with acetic acid, alcohol and acetone. In alkali-formers the fractions of nucleoproteids and neutral proteins precipitated by acetic acid and which are characteristic for three other strains were completely absent. The alcohol soluble protein precipitated by acetone from the salt extract of 0.14 M NaCl, in intestinal bacilli is not at all apparent, in alkali-formers is weakly represented, becomes more apparent in paratyphoids, and is evident much more in the control Breslau culture. Rabbits were immunized with the nucleoproteid and protein preparations received by fractionization and their serum

Card 3/5

Microbiology.

F-6

Abs Jour: Referat. Zh.-Biol., No. 9, 1957, 356⁴⁴

was studied in the crossed reactions of precipitation with all the fractions of each of the 4 strains in order to determine the general and specific antigens entering into them. Indicating the genetic bond between the intestinal bacilli and the Breslau bacteria is the presence of group antigens in the majority of their fractions and the presence in paratyphoid bacteria of antigens specific for intestinal bacilli. The fraction of alkali-formers, defined as a residue, contains antigens specific to intestinal bacilli, paratyphoid bacilli, paratyphoid and alkali-formers. In the complex of the fraction of alkali-formers of a one-molar extract containing DNA, an antigen was exposed which was specific to paratyphoid bacilli and paratyphoid. One of the alkali fraction

Card 4/5

F-6

Microbiology.

Abs Jour: Referat. Zh.-Biol., No. 9, 1957, 35644

extracts of paratyphoid contains a group antigen, common to intestinal bacilli, paratyphoid bacilli and paratyphoid; an antigen, common only to alkaliformers and paratyphoid; and an antigen common to intestinal bacilli and paratyphoid. The chemical composition and antigen structure of paratyphoid is extremely close but not identical to that of the Breslau bacteria. The appearance of identical antigens in different fractions of various microbes is evidence of the biochemical reorganization of their nucleoproteids.

2089. TIMAKOV V. D. and GOLDFARB D. M. N. F. Gamalei Inst. of Epidemiol. and Microbiol., Acad of Med. Sci. of the USSR, Moscow. * Experimental basis of a new method of detecting dysentery and typhoid

2089

bacteria by the use of phage (Russian text) Z. MIKROBIOL.
1956, No. 10 (3-9) Tables 3

The authors propose a new method of detecting dysentery and typhoid bacteria without isolating them in pure culture. An increase in the number of particles of a standard phage after a period of intracellular growth constitutes a positive result. The phage used for this purpose must possess definite properties (range of activity, titre etc.). A dysentery phage, lysing Flexner and Sonne bacteria, was used in the experiments. The plan of the experiments was as follows: To broth containing different concentrations of bacteria were added 0.5 ml. quantities of the indicator phage in a dilution 10^{-2} . The test mixtures and the corresponding controls were kept at 37° C. for 1-5 hr. From each test tube 0.1 ml. was taken and diluted in broth, the dilutions were heated (58°, 30 min.) and the number of plaques on solid medium determined. The sensitivity of the method increases proportionally with the length of time the phage is in contact with the cells. Large concentrations of bacteria can be detected after a short duration of contact. The results of the test are read after 7-11 hr. By this method, dysentery bacteria were detected in artificially infected water and in faeces in the presence of large concentrations of E. coli, where the method of isolating pure cultures did not give positive results.

bacteria are similar to the morphology of L-forms of Streptobacillus moniliformis and to the causative agent of pleuropneumonia in cattle. The dynamics are described of the formation of these forms. By passing the L-form cultures into a 20% serum agar without penicillin, their reversion into bacilli forms is observed. Differences are shown in the formation rate of large bodies, vacuoles and granular forms depending on the concentration of penicillin in the medium. 5 microphotographs.

Title : Comparative Study of Streptomycin-Resistant Variants of Typhoid Bacilli of Different Virulence. Report 1.

Orig Pub : Zh. mikrobiol., epidemiol. i immunobiologii, 1957, No 8, 3-8.

Abstract : From the same culture of typhoid bacilli two variants were obtained resistant to 200,000 units of streptomycin, which differed markedly in their virulence. The avirulent variant is characterized by diminished reproduction rate and a considerable decrease in the size of colonies. Comparative chemical analysis showed that the resistant variants differ from the original culture by an increased content of RNA, especially the avirulent strain. The latter

Title : The Problem of Lysogeny. (Survey of Literature).

Orig Pub : Zh. mikrobiol., epidemiol. i immunobiol., 1957,⁵⁷ No. 12, 82-89.

Abstract : Survey of the subject of lysogeny and transduction. In the opinion of the authors there is no great difference between the latent (moderate) and virulent phages. In connection with this and also in view of the existence of numerous latent virus infections in nature, the authors believe that the phenomenon of lysogeny does not contradict the exogenous theory on the nature of phage. The bibliography contains 68 titles.
